

SOLEKA, solar power production forecasting tool

Worldwide, solar projects are currently massively being implemented. That means two things. First, the electricity production has evolved from a centralized production to a decentralized one, leading to its chaotic management. Second, it has become anecessity to manage the predictability of this intermittent energy.

Thus, the interest of Soleka !

Soleka can give predictions on three levels:

- **1-Day Ahead forecasting** in order to convey to the distribution network operators the next day's production capacity so they can plan their means of production.
- **4-Hour Ahead forecasting** which allows the photovoltaic electricity storage operators to confirm or invalidate their production commitments without risking penalties.
- **15 to 30-Minute Ahead forecasting** which enables the electricity suppliers to securely provide their energy and to optimize their production means inside the grid.

Soleka is a unique and patented solar power production forecasting tool.

Soleka can help distribution network operators, photovoltaic electricity storage operators and energy suppliers to plan and optimize their solar electricity production.
